Overview

This document describes API Services definition for BNI API Management Solution: RDL P2P Lending services.

Workflow API Solution

Register A Lender

P2P lending could use the Register Investor Services to create an bank account. If the Investor or Lender already have an account in BNI, the Register Investor Services will provide the existing CIF number.

Create Lender Account

P2P lending could use the Register Investor's Account Services to create a RDL account. In this services, it needs **cifNumber** field which is provided once the P2P Lending system hits **Register Investor** Service.

P2P Lending Transaction

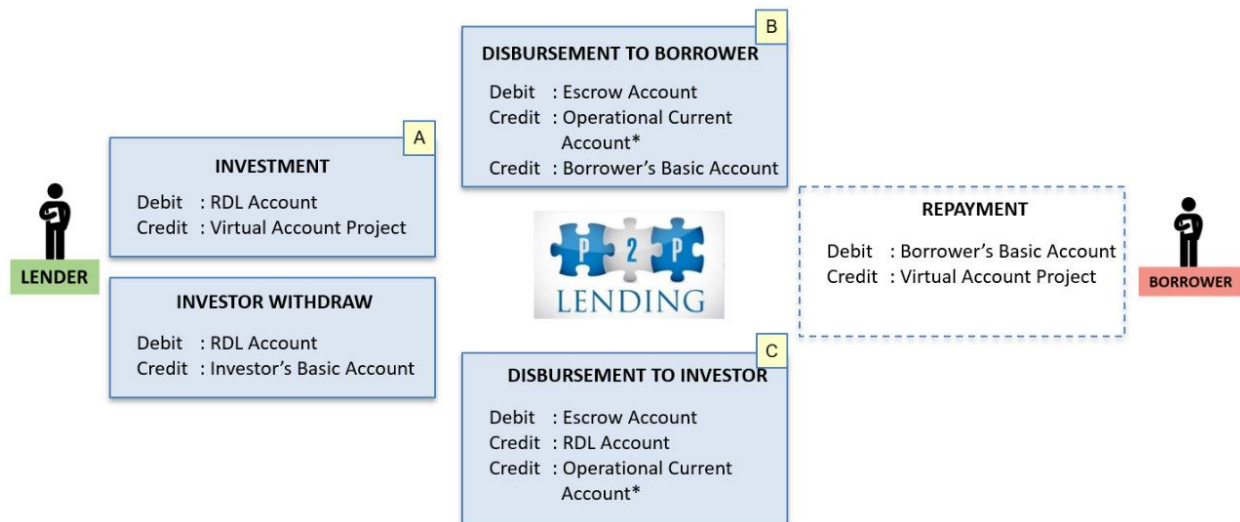

Before managing the transaction, P2P lending has to provide types of account which are:

1. Lender's account or RDL
2. Investment or escrow account
3. Virtual Account (provided in another document)
4. Investor's or Borrower's Basic Account
5. Operational Account

Basically, BNI provided several Payment services to run the transaction flow, which are:

1. Payment using transfer for BNI to BNI account
2. Payment using Clearing for BNI to another bank's account (amount transferred max <= IDR 1 billion and D+1)
3. Payment using RTGS for BNI to another bank's account (amount transferred > IDR 1 billion and D+1)
4. Payment using Interbank BNI to another bank's account (amount transferred < IDR 25 milion and real time)

Here is the basic transaction flow for P2P Lending

NOTE:

- It is just a basic transaction. P2P Lending partners are able to provide another business flow as long as it complies with OJK's regulation.
- For point A, B, and C, please ensure that P2P has set the loan identity value in remark fields. Therefore, the loan identity will be shown in the account statement.

Operation Definition

This section explains about API services provided by BNI. Each client will be shared the following properties to authorize API integration.

API Properties	Description
Username	Client username
Password	Client secret
API Key	Key to call specified operations
API Secret Key	Secret key for generating Digital Signature

Get API Token

This operation should be called to get API token to be passed to request the other service.

JWT Digital Signature

JWT (JSON Web Tokens) consist of three parts separated by dots(.), which are header, payload, signature.

To create a JWT Digital Signature, perform the following steps:

- Construct a JWT header in the following format:

```
{
  "alg": "HS256",
  "typ": "JWT"
}
```

- Base64url encode the JWT header, which results in the following:

eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9

- Create a JWT Payload in the following format (JSON):

Example for Service: Inquiry Account Info

```
{
  "request": {
    "header": {
      "companyId": "SANDBOX",
      "parentCompanyId": "STI_CHS",
      "requestUuid": "E26DB4C8F6484E72"
    },
    "accountNumber": "0115476117"
  }
}
```

} }

Note : JWT Payload depends with the REST Body Payload

- d. Base64url encode the JWT payload, which results in the following:
`eyJyZXF1ZXN0Ijp7Imh1YWRLci6eyJjb21wYW55SWQhOiJ0JTQ5EQk9YiIiwicGFyZW50Q29tcGFueUlkljoiU1RXN0NIUyIsInJlcXVlc3RvZWkljoiQTJFNjk3MzgxOEYzNEJCOCJ9LCJjaWZOdW1iZXliOiI5MTAwNzQ5OTU5IiwiaWYwNjB3VudFR5cGUhOiIjSREwiLCJjdXJyZW5jeSI6IklEUilsm9wZW5BY2NvdW50UmVhc29uljoiMilsInNvdXJlZU9mRnVuZCj6IjEiLCJicmFuY2hJZCj6Ij10SJ9fQ`
- e. Encoded header, the encoded payload, a secret, and sign that with HMAC SHA256 algorithm, for example:
HMACSHA256(base64urlEncode(header)+"."+base64urlEncode(payload), API Secret Key)
Putting All together base64url string separated by dots, which results in the following
`eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJyZXF1ZXN0Ijp7Imh1YWRLci6eyJjb21wYW55SWQhOiJ0JTQ5EQk9YiIiwicGFyZW50Q29tcGFueUlkljoiU1RXN0NIUyIsInJlcXVlc3RvZWkljoiQTJFNjk3MzgxOEYzNEJCOCJ9LCJjaWZOdW1iZXliOiI5MTAwNzQ5OTU5IiwiaWYwNjB3VudFR5cGUhOiIjSREwiLCJjdXJyZW5jeSI6IklEUilsm9wZW5BY2NvdW50UmVhc29uljoiMilsInNvdXJlZU9mRnVuZCj6IjEiLCJicmFuY2hJZCj6Ij10SJ9fQ.eAdP0GEoPxLj3S3_BxlUyBrIPMKZjyJZjvbkV30jY`
- f. Add JWT signature to field {header.signature} in request message:

```
{  
    "request": {  
        "header": {  
            "signature":  
                "eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJyZXF1ZXN0LWVudCkiOiJkSj9JLCJhY2VndW50TnVtYmVyIjoieMDEeNTQ3NjExejNyJ9fQ.kV30jyY",  
            "companyId": "SANDBOX",  
            "parentCompanyId": "STI_CHS",  
            "requestUuid": "E26DB4C8F6484E72"  
        },  
        "accountNumber": "0115476117"  
    }  
}
```

Code snippet example:

PHP Programming

```
// Initialize key
$apiSecretKey = 'aff9359f-3b0a-4dd4-9867-5aa73a821a21'; //please adjusted

// Create token header as a JSON string
$array_header = array (

                    'parentCompanyId' => 'STI_CHS',
                    'requestUuid' => '067CE8FE29714FA9',
                ),
            ),
    ),
);
```

```
        'accountNumber' => '0114487154',
    ),
);
$payload = JSON_encode($array_payload, JSON_UNESCAPED_SLASHES);

// Encode Header to Base64Url String
$base64UrlHeader = str_replace(['+', '/', '='], ['-', '_', ''], base64_encode($header));

// Encode Payload to Base64Url String
$base64UrlPayload = str_replace(['+', '/', '='], ['-', '_', ''], base64_encode($payload));

// Create Signature Hash
$signature = hash_hmac('sha256', $base64UrlHeader . "." . $base64UrlPayload, $apiSecretKey, true);

// Encode Signature to Base64Url String
$base64UrlSignature = str_replace(['+', '/', '='], ['-', '_', ''], base64_encode($signature));

// Create JWT
$jwt = $base64UrlHeader . "." . $base64UrlPayload . "." . $base64UrlSignature;

echo $jwt;
